

Inforad K1 GPS powered radar detector

After their older model [v4e](#), [Inforad](#) now came out with even a smaller version of their GPS powered radar detector. Called **Inforad K1**, this radar detector is completely redesigned. First off they finally added a rechargeable battery. Can't fit much into this USB stick sized device so it is only 220mAh; good enough for about five hours. However it charges via USB, which means you can charge it pretty much anywhere these days.

As far as features, K1 offers audible and visual alarms using the two LED which can light up different colors. There is also the integrated trip recorder and of course and the updates of radar databases are free for the life of the product.

Measuring only 2x7.4x1.5cm and weighing only 25 grams the Inforad K1 is very small and light. It can be fixed behind the rear view mirror on your windshield if you want it out of your sight.

Inforad K1 will be available starting mid July, with 2 years guarantee for only 50 ^...
